

Production.Build.Run

Due to the fact that Spring for building application uses Maven, you should configure your project to build a jar or war (as appropriate) by using the usual packaging element, as shown in the following example:

```
cat /{path/to/project/directory}/pom.xml

<?xml version="1.0" encoding="UTF-8"?>
<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/xsd/maven-4.0.0.xsd">
  ...
  <groupId>dwfe</groupId>
  <artifactId>api</artifactId>
  <version>0.0.1</version>
  <packaging>jar</packaging>
  <name>nevis-backend</name>
  ...
</project>
```

When you build directly, note that Nevis Backend project uses the Maven profile system. Therefore, when building, you must explicitly specify the Production profile:

ATTENTION. You must define your own app properties *before* you build your application

```
cd /{path/to/project/directory}
mvn package -P production -Dmaven.test.skip=true

[INFO] Scanning for projects...
[INFO]
[INFO] -----
[INFO] Building nevis-backend 0.0.1
[INFO] -----
...
[INFO] --- maven-jar-plugin:3.0.2:jar (default-jar) @ api ---
[INFO] Building jar: /Users/zoomall/IdeaProjects/nevis-backend/target/api-0.0.1.jar
[INFO]
[INFO] --- spring-boot-maven-plugin:2.0.4.RELEASE:repackage (default) @ api ---

```

Now, to run the application, you can type the following:

```
java -jar /{path/to/App/directory}/api-0.0.1.jar

  ____
 /  _ \
(  ) \
 \  \  \
  '   |
  ____|_
=====|_=====
:: Spring Boot ::      (v2.0.4.RELEASE)
...
...
...
```
